

I'm not robot!

Removing pages of a pdf This uses the package pdftk . To Download the file you first pull it off the web. cd ~ - cd Downloads/ wget " Then you install the package ./pdftk free-2.02-win-setup.exe To find where the executable file was saved, use the where command where pdftk To add the pdftk to your path, add it to .bashrc and source it echo 'alias pdftk="C:/Program Files\ (x86)\PDFtk/bin/pdftk.exe" ' >> ~/.bashrc source ~/.bashrc Now cd to the file of interest is cd d:/Documents/BoxSync/Classes Spring2021/Advanced Biostatistics EEB590C/Lectures/ The actual commands for removing pages are below. The format is "pdftk (input.pdf) cat 1-9 26-end output {outputfile.pdf}" In this example the input.pdf and outputfile.pdf are what you change and the numbers of the pages we are keeping are 1-9 and 26 until the end of the document. #example #pdftk input.pdf cat 1-9 26-end output outputfile.pdf pdftk 10\_Multivariate Association and Canonical Ordination Methods.pdf cat 1-40 43-end output 10\_Multivariate Association and Canonical Ordination Methods altered.pdf You can't perform that action at this time. You signed in with another tab or window. Reload to refresh your session. You signed out in another tab or window. Reload to refresh your session. As it turns out, I can do it with imagemagick. If you don't have it, install simply with: sudo apt-get install imagemagick Note 1: I've tried this with a one-page pdf (I'm learning to use imagemagick, so I didn't want more trouble than necessary). I don't know if/how it will work with multiple pages, but you can extract one page of interest with pdftk; pdftk A=myfile.pdf cat A1 output page1.pdf where you indicate the page number to be split out (in the example above, A1 selects the first page). Note 2: The resulting image using this procedure will be a raster. Open the pdf with the command display, which is part of the imagemagick suite: display file.pdf Mine looked like this: Click on the image to see a full resolution version Now you click on the window and a menu will pop to the side. There, select Transform | Crop. Back in the main window, you can select the area you want to crop by simply dragging the pointer (classic corner-to-corner selection). Notice the hand-shaped pointer around the image while selecting This selection can be refined before proceeding to the next step. Once you are done, take notice of the little rectangle that appears on the upper left corner (see the image above). It shows the dimensions of the area selected first (e.g. 281x218) and second the coordinates of the first corner (e.g. +256+215). Write down the dimensions of the selected area; you'll need it at the moment of saving the cropped image. Now, back at the pop menu (which now is the specific "crop" menu), click the button Crop. Finally, once you are satisfied with the results of cropping, click on menu File | Save Navigate to the folder where you want to save the cropped pdf, type a name, click the button Format, on the "Select image format type" window select PDF and click the button Select. Back on the "Browse and select a file" window, click the button Save. Before saving, imagemagick will ask to "select page geometry". Here, you type the dimensions of your cropped image, using a simple letter "x" to separate width and height. Now, you can do all this perfectly from the command line (the command is convert with option -crop) -- surely it's faster, but you would have to know beforehand the coordinates of the image you want to extract. Check man convert and an example in their webpage. 2 minute read Published: December 07, 2014 Taking out pages from PDF files, binding PDFs together, and removing PDF security. Here are a couple of free programmes to perform these tasks. Taking out pages from a PDF PDFtk command to delete the first page of a PDF. Sometimes PDFs contain a title page or blank pages that you might want to remove. PDFtk Server is a useful command line tool that can take pages out from a PDF file. To remove the title page from a PDF file, run the following command: pdftk input.pdf cat 2-end output output.pdf Set the pages you want to maintain within the document after the cat command, and change input.pdf and output.pdf to suit. Merging PDF files You may wish to combine a journal article with its supplementary information, or with comment letters and author responses. Again PDFtk can do this. To combine two pdf files into one: pdftk input1.pdf input2.pdf cat output combined.pdf PDFtk can also perform a host of other useful tasks - see its examples page. Removing PDF Security Sometimes PDF files come with encryption settings that prevent you from doing the above, or from performing OCR on the document. I find that QPDF works well for removing the security settings, even if you do not know the PDF password. To remove the security settings from a file run: qpdf --decrypt input.pdf output.pdf However QPDF does not always succeed. An alternative is to use a PDF printer driver to 'print' an unencrypted PDF. Examples of such software for Windows include CutePDF, Bullzip, PDFCreator etc. Preview on Mac will also 'Export as PDF'. Ghostscript can also perform this task: gs -q -dNOPAUSE -dBATCH -sDEVICE=pdfwrite -sOutputFile=output.pdf -c .setpdfwrite -f input.pdf More Powerful Manipulation of PDFs The python package pyPdf can be used to perform PDF file operations with the benefit of easy scripting ability. For instance when merging many hundreds of PDF sections of a larger document, each with a filename describing one part of the document (front matter, initial pages with Roman numerals, main pages...), I wrote a python script to merge the files in the correct order. Edits 9th June 2015 - Added ghostscript command to print to a new PDF file If you are a keen book reader, it would be quite difficult for you to carry even more than two books. That's no more the case, thanks to ebooks that save a lot of space in your home and your bag as well. Carrying hundreds of books with you is literally no more a dream. Ebooks come in different formats, but the common one is PDF. Most of the ebook PDFs have hundreds of pages, and just like real books, with the help of a PDF reader navigating these pages is quite easy. Suppose you are reading a PDF file and want to extract some specific pages from it and save it as a separate file; how would you do that? Well, it is a cinch! No need to get premium applications and tools to accomplish it. This guide focuses on extracting a specific part from any PDF file and saving it with a different name in Linux. Though there are multiple ways to do this, I will be focusing on the less cluttered approach. So, let's begin: There are two main approaches: Extracting PDF pages through GUI Extracting PDF pages through the terminal You can follow any method according to your convenience. How to extract PDF pages in Linux via GUI: This method is more like a trick for extracting pages from a PDF file. Most of the Linux distributions come with a PDF reader. So, let's learn a step by step process of extracting pages using the default PDF reader of Ubuntu:\ Step 1: Simply open your PDF file in the PDF reader. Now click on the menu button and as shown in the following image: Step 2: A menu will appear; now click on the "Print" button, a window will come out with print options. You can also use the shortcut keys "ctrl+p" to quickly get this window: Step 3: To extract pages in a separate file, click on the "File" option, a window will open, give the file name, and select a location to save it: I am selecting "Documents" as the destination location: Step 4: These three output formats PDF, SVG, and Postscript check PDF: Step 5: In the "Range" section, check the "Pages" option and set the range of page numbers you want to extract. I am extracting the first five pages so that I would type "1-5". You can also extract any page from the PDF file by typing the page number and separating it by a comma. I am extracting pages number 10 and 11 along with a range for the first five pages. Note that the page numbers I am typing are according to the PDF reader, not the book. Ensure that you enter the page numbers that the PDF reader indicates: Step 6: Once all the settings are done, click on the "Print" button, the file will be saved in the specified location: How to extract PDF pages in Linux via terminal: Many Linux users prefer to work with the terminal, but can you extract PDF pages from the terminal? Absolutely! It can be done; all you need a tool to install called PDFtk. To get PDFtk on Debian and Ubuntu, use the command given below: For Arch Linux, use: PDFtk can also be installed through snap: Now, follow the below-mentioned syntax to use PDFtk tool for extracting pages from a PDF file: \$pdftk [sample.pdf] cat [page\_numbers] output [output\_file\_name.pdf] [sample.pdf] - Replace it with the file name from where you want to extract pages. [page\_numbers] - Replace it with the range of page numbers, for example, "3-8". [output\_file\_name.pdf] - Type the name of the output file of extracted pages. Let's understand it with an example: \$pdftk adv\_bash\_scripting.pdf cat 3-8 output extracted\_adv\_bash\_scripting.pdf In the above command, I am extracting 6 pages (3 - 8) from a file "adv\_bash\_scripting.pdf" and saving extracted pages by the name of "extracted\_adv\_bash\_scripting.pdf." The extracted file will be saved in the same directory. If you need to extract a specific page, then type the page number and separate them by a "space": \$pdftk adv\_bash\_scripting.pdf cat 5 9 11 output extracted\_adv\_bash\_scripting\_2.pdf In the above command, I am extracting page numbers 5, 9, and 11 and saving them as "extracted\_adv\_bash\_scripting\_2". Conclusion: You may occasionally need to extract some specific portion of a PDF file for several purposes. There are many ways to do it. Some are complex, and some are obsolete. This write-up is about how to extract pages from a PDF file in Linux through two simple methods. The first method is a trick to extract a certain part of a PDF through Ubuntu's default PDF reader. The second method is via terminal since many geeks prefer it. I used a tool called PDFtk to extract pages from a pdf file through the use of commands. Both methods are simple; you can choose any according to your convenience.
